

20-V 200-mA Ultra-Low Noise Ultra-High PSRR Low Dropout Linear Regulator

Features

- Wide Input Voltage Range: 2.5 V to 20 V
- Adjustable Output Voltage Range: 1.2 V to 15 V
- $\pm 2\%$ Accuracy over Line Regulation, Load Regulation, and Operating Temperature Range
- 200-mA Maximum Output Current
- Low Dropout Voltage: 400 mV Max at 200 mA
- Ultra-High PSRR:
 - 110 dB at 1 kHz
 - 80 dB at 1 MHz
- Ultra-Low Output Noise:
 - $1 \mu\text{V}_{\text{RMS}}$ from 10 Hz to 100 kHz
 - $2 \text{ nV}/\sqrt{\text{Hz}}$ at 10 kHz
- Excellent Transient Response
- Precision Enable Threshold
- Adjustable Current Limit with External Resistor
- Open-Drain Power Good Indication
- Adjustable Power-Good Threshold
- Stable with a minimum 4.7- μF Output Capacitor
- Integrated Protection
 - Over-Current Protection
 - Over-Temperature Protection
- Package Options:
 - DFN3X3-10

Applications

- Low-Noise Power Supplies
- Analog Supply: PLL, VCO, Mixer, LNA, ADC
- Low-Noise Instrumentation
- ATE Test Equipment

Description

The TPL8033 is a 20-V 200-mA high-performance low-dropout linear regulator with $1\text{-}\mu\text{V}_{\text{RMS}}$ ultra-low noise and 110-dB ultra-high PSRR. The TPL8033 supports adjustable output from 1.2 V to 15 V with a single resistor and is stable with 4.7 μF to 100 μF .

The TPL8033 implements a precision current reference and a high-performance voltage buffer. With an external capacitor connecting to the current reference, the output voltage noise can be further reduced.

The TPL8033 features adjustable output current limit with a single external resistor and adjustable power-good threshold with an external resistors divider. The TPL8033 also integrates over-current protection and over-temperature protection to enhance system reliability.

The TPL8033 provides thermal-enhanced 10-pin DFN3X3 and EMSOP packages with guaranteed operating temperature ranging from -40°C to $+125^{\circ}\text{C}$.

Table 1. Pin Functions: TPL8033

Pin	Name	I/O	Description
DFN3X3			
3	EN/UV	I	Enable/UVLO pin. Drive EN/UV high to turn on the regulator; drive EN/UV low to turn off the regulator. Connecting an external resistor divider from IN, EN/UV to GND to set the UVLO threshold. For automatic startup, connect EN to IN directly.
8	GND	-	Ground reference pin. Connect GND to PCB ground plane directly.
5	ILIM	O	Current limit adjustment pin. Connect a resistor from ILIM to GND to set an accurate output current limit value.
1, 2	IN	I	Input voltage pin. A 10- μ F or larger ceramic capacitor from IN to GND (as close as possible to IN pin) is required to reduce the jitter from the previous-stage power supply.
10	OUT	O	Regulated output voltage pin. A 4.7- μ F or larger ceramic capacitor from OUT to GND (as close as possible to OUT pin) is required to ensure the regulator stability.
9	OUTS	I	Output voltage sense input pin. Kelvin connect OUTS to the output capacitor and the load.
4	PG	O	Open-drain power-good output pin. Leave PG open if not used.
6	PGFB	I	Power-good threshold-setup pin. Connecting an external resistor divider from OUT, PGFB to GND to set the programmable power good threshold. Tie PGFB to IN directly if power good and fast start-up functionalities are not used.
7	SET	O	Output voltage setup pin. Connect a resistor from SET to GND to set the output voltage. A capacitor from SET to GND is recommended to improve output noise, PSRR and transient response performance.

(1) The exposed Pad MUST be connected to a large-area ground plane directly to maximize the thermal performance.

20-V 200-mA Ultra-Low Noise Ultra-High PSRR Low Dropout Linear Regulator

Specifications

Absolute Maximum Ratings ⁽¹⁾

Parameter		Min	Max	Unit
IN, EN/UV		-0.3	22	V
OUT, OUTS, SET		-0.3	16	V
PG, PGFB		-0.3	22	V
OUT - OUTS		-1.2	1.2	V
ILIM		-0.3	1	V
T _J	Maximum Junction Temperature	-40	150	°C
T _{STG}	Storage Temperature Range	-65	150	°C
T _L	Lead Temperature (Soldering 10 sec)		260	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

(2) All voltage values are with respect to ground.

ESD, Electrostatic Discharge Protection

Parameter		Condition	Minimum Level	Unit
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±3000	V
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Recommended Operating Conditions

Detailed Description

Overview

The TPL8033 is a 20-V 200-mA high-performance low-dropout linear regulator with 1- μV_{RMS} ultra-low noise and 110-dB ultra-high PSRR. The TPL8033 support adjustable output from 1.2 V to 15 V with a single resistor and is stable with 4.7 μF to 100 μF .

The TPL8033 implements a precision current reference and a high-performance voltage buffer. With an external capacitor connecting to the current reference, the output voltage noise can be further reduced.

The TPL8033 features adjustable output current limit with a single external resistor and adjustable power-good threshold with an external resistors divider. The TPL8033 also integrates over-current protection and over-temperature protection to enhance system reliability.

Functional Block Diagram

Figure 34. Functional Block Diagram

Feature Description

Enable/UVLO (EN/UV)

The TPL8033 integrates an EN/UV pin to turn on or turn off the device. This pin has an accurate 1.23-V turn-on threshold with 120-mV hysteresis. This EN/UV threshold can be used to set an accurate under-voltage lockout (UVLO) threshold of the input voltage with a resistor divider connected from V_{IN} to GND. The UVLO threshold can be calculated according to Equation 1.

$$V_{\text{IN, UVLO}} = 1.23\text{V} \times \left(1 + \frac{R_{\text{EN2}}}{R_{\text{EN1}}}\right) + I_{\text{EN}} \times R_{\text{EN2}} \quad (1)$$

where,

- R_{EN1} is the low-side resistor connected from the EN/UV pin to the GND pin.
- R_{EN2} is the high-side resistor connected from the IN pin to the EN/UV pin.
- I_{EN} is the EN/UV pin current. This current can be neglected if the R_{EN1} is less than 100 k Ω .

20-V 200-mA Ultra-Low Noise Ultra-High PSRR Low Dropout Linear Regulator

If accurate UVLO is not used, connect EN/UV pin to VIN directly or a digital logic control circuit.

Figure 35. UVLO Threshold

Adjustable Output Voltage (SET, OUT, OUTF)

The TPL8033 integrates a precision 100- μ A current source flowing out of the SET pin. The output voltage can be set by connecting an external resistor (R_{SET}) and capacitor (C_{SET}) at this SET pin. Below table provides different output voltage options with corresponding external resistors.

The OUTF pin of the TPL8033 provides a Kelvin sense connection to the output. The ground side of the resistor at the SET pin provides a Kelvin sense connection to the ground side of the load.

Table 2. Output Voltage and R_{SET} Resistors

V_{OUT} (V)	R_{SET} (k Ω)
2.5	24.9
3.3	33.2
5	49.9
12	121
15	150

Figure 36. OUTF Pin Kelvin Sense Connection

Power Good (PG)

The TPL8033 integrates an open-drain output power good indicator. Connect the PG pin to a pull-up voltage through a resistor from 10 k Ω to 100 k Ω if the power good function is used. Leave the PG pin open if it is not used.

After regulator startup, the PG pin keeps low impedance until the output voltage reaches the power good threshold, $V_{PG,TH}$. When the output voltage is higher than $V_{PG,TH}$, the PG pin turns to high output impedance, and PG is pulled up to a high voltage level to indicate the output voltage is ready.

Please note, the power good function is disabled in shutdown mode.

20-V 200-mA Ultra-Low Noise Ultra-High PSRR Low Dropout Linear Regulator

Adjustable Power Good Threshold (PGFB)

The TPL8033 integrates an adjustable power-good threshold, of which the value can be set by an external resistor divider. Use [Equation 2](#) to calculate the power good threshold.

$$V_{PG, TH} = 0.3V \times \left(1 + \frac{R_{PG2}}{R_{PG1}}\right) + I_{PGFB} \times R_{PG2} \quad (2)$$

where,

- R_{PG1} is the low-side resistor connected from the PGFB pin to the GND pin.
- R_{PG2} is the high-side resistor connected from the OUT pin to the PGFB pin.
- I_{PGFB} is the PGFB pin current. This current can be neglected if the R_{PG1} is less than 30 k Ω .

Please note, the adjustable power good function is disabled in shutdown mode.

Figure 37. Power Good Threshold

Over-Current Protection(ILIM)

The TPL8033 integrates a current limit circuit that helps to protect the device during fault conditions. The default current limit value is typically 320 mA, and the TPL8033 also provides an adjustable option set by an external resistor R_{LIM} . Use [Equation 3](#) to calculate the adjustable current limit value.

$$\text{Current} \quad (3)$$

For example:

- when $R_{LIM} = 2.5 \text{ k}\Omega$, the output current limit is set to 50 mA.
- when $R_{LIM} = 625 \Omega$, the output current limit is set to 200 mA.

Over-Temperature Protection

The over-temperature protection starts to work when the junction temperature exceeds the thermal shutdown threshold, which turns off the regulator immediately. Until when the device cools down and the junction temperature falls below a value which equals to the thermal shutdown threshold minus thermal shutdown hysteresis, the regulator turns on again.

The junction temperature range should be limited according to the [Recommended Operating Conditions](#) table, continuously operating above the junction temperature range reduces the device lifetime.

Application and Implementation

Note

Information in the following application sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

Application Information

The TPL8033 is a 20-V 200-mA high-performance low-dropout linear regulator with 1- μV_{RMS} ultra-low noise and 110-dB ultra-high PSRR.

Typical Application

The [Figure 38](#) shows the typical application schematic.

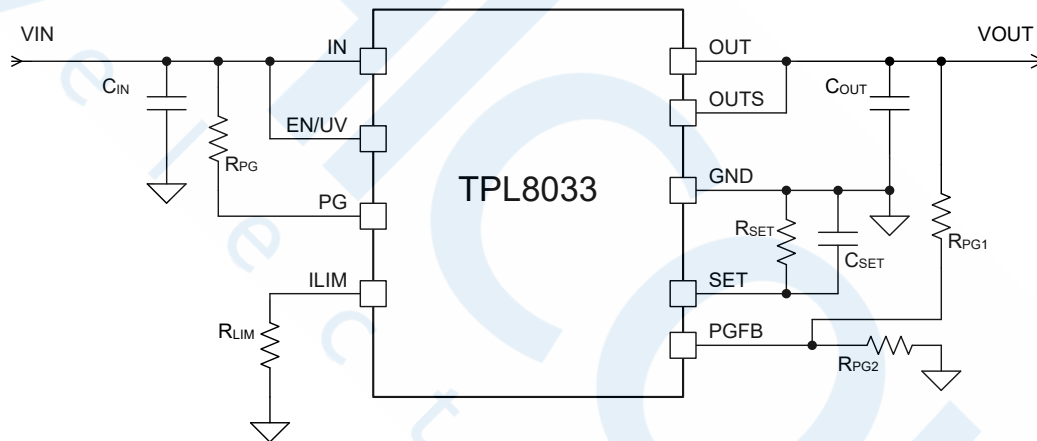

Figure 38. Typical Application Circuit

Input Capacitor and Output Capacitor

3PEAK recommends adding a 10- μF or greater capacitor at the IN pin to keep the input voltage stable. The voltage rating of the capacitors must be higher than the maximum input voltage.

To ensure the loop stability, the TPL8033 requires a ceramic capacitor from 4.7 μF to 100 μF at the regulator output. 3PEAK recommends selecting a 10- μF or greater X7R ceramic capacitor with low ESR range at the OUT pin.

Both input capacitors and output capacitors must be placed as close to the device pins as possible.

Power Dissipation and Thermal Consideration

During the normal operation, the LDO junction temperature should meet the requirement in the [Recommended Operating Conditions](#) table. Use the equations below to calculate the power dissipation and estimate the junction temperature.

The power dissipation can be calculated using below equation.

$$P_D = (V_{IN} - V_{BAT}) \times I_{OUT} + V_{IN} \times I_{GND} \quad (4)$$

The junction temperature can be estimated using below equation. θ_{JA} is the junction-to-ambient thermal resistance.

$$T_J = T_A + P_D \times \theta_{JA} \quad (5)$$

Layout

Layout Guideline

- Both input capacitors and output capacitors must be placed as close to the device pins as possible.
- It is recommended to bypass the IN pin to ground with a 10- μ F capacitor in parallel with a 0.1- μ F small ceramic capacitor. The loop area formed by the bypass capacitor connection, the IN pin, and the GND pin of the system must be as small as possible.
- It is required to place a decoupling 4.7- μ F or greater capacitor at the output. A small 0.1- μ F ceramic capacitor in parallel is recommended to filter the noise and improve the output transient performance.
- It is recommended to use wide and thick trace to minimize $I \times R$ drop and heat dissipation.

Layout Example
