CODE MOBILE APPS
WITH DIGI XBEE
VIA BLUETOOTH

DIGI XBEE MOBILE SDK

Create mobile applications that connect with Digi XBee modules via Bluetooth

Digi XBee® Mobile SDK is a set of libraries, code examples and documentation designed to simplify the creation of iOS and Android mobile apps that interact with Digi XBee 3 modules via Bluetooth.

Bluetooth enables local connectivity to Digi XBee modules via a mobile device to streamline network deployment, configuration and troubleshooting.

BLE can also be used as a communication channel to create a Human Machine Interface (HMI) in a smartphone or tablet to monitor and control a device that does not have a display.

Digi XBee Mobile SDK helps speed up the development of mobile applications that interact with Digi XBee devices over the Bluetooth Low Energy interface.
Digi XBee Mobile SDK includes:

• Well-documented APIs to handle the complexity of the Bluetooth authentication, encryption and communication processes

• Two libraries to simplify mobile app development:

  – A Digi XBee library for Xamarin, to develop native cross-platform (iOS and Android) mobile applications using C#

  – A Digi XBee library for Android, to develop native Android applications using Java

• Comprehensive documentation

• Example applications for both libraries

Access to the software libraries, examples and documentation can be found on the Digi support site.

CUSTOM BLUETOOTH APP EXAMPLES

– Configure Digi XBee firmware settings during deployment

– Exchange data between a mobile application and a MicroPython application running on Digi XBee 3

– Exchange data between a mobile application and the host micro-controller
